Erik Eckel explains the options for using adapters and AirPlay to mirror iPads' displays on larger monitors for meetings, presentations, and seminars. Poorly informed critics knock the iPad for "lacking business functionality." But the truth is the iPad possesses tremendous professional potential. That's one of the reasons Apple just sold three million of the tablets in four days. Yet, despite all the hype surrounding the device, many business users are unaware of just how easy it is to leverage iPads for presentations, in meetings, and when hosting seminars. Adapters Possibly the easiest method for connecting iPads to large displays is using adapters. One end of the \$39 Apple Digital AV Adapter plugs into the iPad's dock connector. The adapter's other end contains an HDMI port, enabling users to connect an HDMI cable to monitors, video projectors, conference room displays and widescreen flat panels. Since the adapter leverages HDMI technology, the adapter passes both audio and video information to the display. Business professionals that rely upon iPads to fuel presentations need not worry the iPad's power will flake out. The Digital AV Adapter includes a built-in 30-pin connector to enable the tablet to continue charging while powering the presentation. Using the Digital AV Adapter, the iPad's display can be mirrored to HDMI-compatible displays. Whatever appears on the iPad's display appears on the external monitor to which the adapter is connected. Video quality is impressive, as the iPad's display is mirrored in up to 1080p HD with movies playing back in 720p HD. The \$29 Apple VGA Adapter is another alternative. The device enables video mirroring on iPad 2 and later iPads. Using the VGA adapter, slideshows, video and other presentation material can be displayed on VGA-compatible 1080p HD screens. Just as with the Digital AV Adapter, movie playback is at 720p HD on compatible monitors. AirPlay Using an Apple TV connected to a large screen, presenters can also use iPads to wirelessly stream videos and even mirror the iPad's display on large monitors. AirPlay makes it possible. The technology enables iOS devices to stream audio and video to a display connected to the Apple TV. The iOS and Apple TV devices need only to be on the same Wi-Fi network. When the two devices are connected to the same Wi-Fi network, the AirPlay icon will automatically appear (assuming AirPlay is enabled within the Apple TV's Settings menu). Tapping the AirPlay icon within specific apps streams the app's contents to the large screen display. Users can also mirror the iPad display on the large screen (connected by an Apple TV) by selecting the feature on the iPad. To do so, users should press the Home button twice, scroll to the right to access Controls and press the AirPlay icon (which appears as a rectangle pierced by a triangle). Sometimes, you're using an iPad but the onscreen keyboard doesn't show where you expect it. There could be one of several things going on, including trouble with a Bluetooth keyboard or third-party keyboard apps. Here's what may be wrong—and how to fix it. You Forgot That You Have a Bluetooth Keyboard Connected Whenever you have a Bluetooth keyboard connected to your iPad, iPadOS automatically disables the onscreen keyboard. That's because the iPad thinks you don't need an on-screen keyboard when you have a real one in front of you. But sometimes you have a Bluetooth keyboard sitting nearby that is still connected, and you don't realize it. To disconnect your keyboard, open Settings and tap Bluetooth. In the list of "My Devices," locate your keyboard and tap on the info icon next to it (an "i" in a circle). On the next screen, select "Disconnect." Your iPad May Think There Is a Keyboard Connected (When it Isn't) Sometimes, your iPad may think there is a Bluetooth keyboard connected when it actually isn't, so the onscreen keyboard will not show up. Navigate to Settings, tap on "Bluetooth," then tap the Bluetooth switch to turn off Bluetooth. Or, to do it even faster, pull up the Control Center with a swipe and turn Bluetooth off with a tap. Check again and see if the onscreen keyboard appears where you expect it. If not, you might want to try restarting your iPad, which can fix this and other bugs. RELATED: How to Use Control Center on Your iPhone or iPad Your Third-Party Keyboard App May Have Crashed If you use a third-party keyboard app, such as SwiftKey or Gboard, it's possible that a bug in that keyboard app may have caused it to crash. To fix it, restart your iPad, which will force the keyboard to reload and may temporarily clear the problem that caused it to crash. It's also a good idea to launch the App Store and see if there are any updates for the third-party keyboard. If so, install them. The updates may fix the bug that caused the crash. If that doesn't help, you can delete the third-party keyboard app in Settings. Navigate to Settings > General > Keyboard > Keyboards. Tap "Edit" in the upper-right corner of the screen, and then tap on the red remove icon (that looks like a minus sign in a circle) next to the name of the third-party keyboard you want to disable. After tapping on the red minus sign icon, a "Delete" button will appear. Tap that and the keyboard app will be removed. You could then try reinstalling the app using the App Store, or use the iPad without it. RELATED: How to Fix Crashing Apps on an iPhone or iPad You May Need to Tap a Text Field for the Keyboard to Show Usually, iPadOS does a good job of predicting when you'll need the onscreen keyboard, and it pops up accordingly. But sometimes it doesn't. In that case, you may need to tap on a text input field to make the keyboard appear. If it doesn't appear, then check the other possible solutions listed above, including restarting your iPad to see if that fixes the problem. If All Else Fails, Restart or Update If there is a common theme among all the potential solutions listed here, it's that if you encounter trouble on your iPad, it's usually a good idea to restart it. Restarting your iPad forces the device to reload all of its software and reset its temporary settings, which may temporarily solve the issue you are having. To restart an iPad with Face ID: Hold down the top button and either volume button until the power off slider appears. Swipe the slider with your finger and wait for the iPad to power off. Then, hold the top button again until you see the Apple logo on the screen. You could also try updating your iPad's operating system (iPadOS) to the latest version. That may fix any bugs that are keeping the onscreen keyboard from appearing properly. Good luck! RELATED: How to Update Your iPad to the Latest Version of iPadOS The eighth-generation iPad (2020) provides a great Apple tablet experience at a low price. It features possibly the best software you can find on any make of tablet anywhere, while its long-lasting battery and vast ecosystem of useful apps will certainly please the vast majority of users. It also boasts a very clear and colorful 10.2-inch display, which is satisfyingly rich and vibrant despite not being quite as sharp as the screen you can find on an iPad Pro. However, like any other touchscreen, it can be liable to crack if you accidentally drop or hit it. Fortunately, we've rounded up the best iPad (2020) screen protectors you can buy right now. These will keep the iPad's pretty display in one piece, while they'll also retain the screen's responsiveness and detail. Urban Armor Gear Glass Screen Shield Manufactured in Japan, this iPad screen protector from Urban Armor Gear is as tough as it gets. Made of tempered glass, it boasts the maximum 9H hardness rating, so you can rest assured it will withstand scratches from sharp metal objects and all but the most catastrophic of falls. Despite being enviably tough, it is impressively thin, with a maximum thickness of 0.2mm that means you should barely notice it. The protector also features an oleophobic coating, meaning it's very hard to leave fingerprints and smudges on it. Sure, it may not be especially cheap, but it really is one of the best iPad screen protectors out there. Spigen Screen Protector Glas.tr Slim This is a highly durable iPad screen protector from Spigen, which also makes some very good cases. It's built from tempered glass with a 9H rating, so it's going to be among the toughest protectors you can find for the iPad. It also incorporates an oleophobic coating for fingerprint resistance, so it should continue to look very sleek for the duration. On top of this, the protector is designed to be 100% compatible with all Spigen cases for the iPad. Its package also comes with a full installation kit, including wings for easy application. OtterBox Amplify Glass Antimicrobial Screen Protector Here's an iPad screen protector that pretty much goes all-out to provide the best all-round defense for your tablet. On the one hand, it's made of hard aluminosilicate glass, and OtterBox claims it's 5x more scratch-resistant than the average protector. On the other hand, it has been treated with antimicrobial materials, which restricts the growth of the bacteria on your tablet's screen and also lasts for as long as you're likely to use the protector. In addition, it has been designed to be 100% case-compatible regardless of your brand of case. It also comes with an installation kit. JETech Glass Screen Protectors Sold in a pack of two, the JETech Screen Protector for iPad (2020) boasts all the specs you'll need from a protector. It's made of glass with a hardness rating of 9H, which means it will resist the vast majority of scratches without so much as picking up a single blemish. Its tempered glass is also very thin at only 0.33mm, allowing it to provide 100% transparency and a high level of responsiveness. The protector is also fingerprint-resistant and dust-resistant, while it has been designed for easy, bubble-free installation, given that it also comes with a guide stick. Highly recommended. Apiker Glass Screen Protectors Also sold in a pack of two, the Apiker Screen Protector is another user-friendly and highly-reliable protector for the iPad (2020). It comes with a 9H hardness rating, providing your iPad with the fullest resistance against scratches and cracks that's possible with tempered glass. It's also extremely thin, with its 0.3mm thickness ensuring that it doesn't affect the functionality of the touchscreen or interfere with how you use the Apple Pencil (if you have one). This also gives it 99% HD clarity and 99% transparency, while the hydrophobic coating protects your iPad from water and fingerprints. It helpfully comes with an alignment frame, making it easier for you to apply it properly. Supershieldz Film Screen Protectors Here's a screen protector for the iPad (2020) that comes in a high-value pack of three. It's not quite as hard as other protectors on this list, given that it's made of PET film rather than tempered glass. However, it will still protect the iPad from the vast majority of abuse you're likely to hurl at it. The fact that it's made of plastic rather than glass also means that it's more transparent and sensitive than other protectors, allowing you to continue using your iPad as if it weren't even there. Be warned, though, that some buyers have warned of the difficulty of applying this protector (at least in comparison to other products), with the use of PET film increasing the chances of bubbles if you don't install it carefully enough. Omoton Glass Screen Protectors Omoton's Screen Protector for the iPad (2020) is the thinnest protector on this list that's made of glass. At a thickness of only 0.26mm, it provides pretty much the maximum possible amount of transparency and responsiveness you could hope to find from a glass protector, ensuring full compatibility with the Apple Pencil. Not only that, but with a 9H hardness rating, it will guard your iPad against everyday damage. Unlike some protectors, it lacks a hole for the selfie camera, something that should help to protect the camera from dust and debris. It also has a hydrophobic and oleophobic coating, making it resistant to water and fingerprint smudges. As for anyone worried about installation, it's designed to be bubble-free, while its slightly rounded edges make it easier to hold it while applying it to the iPad. Comes in a pack of two. ZoneFoker Glass Screen Protectors Rounding off this list, we have ZoneFoker with its iPad (2020) screen protector. Sold in a pack of two, it's another piece of tempered glass with a 9H hardness rating, making it capable of resisting scratches from hard objects such as keys and knives. It also offers 99.99% transparency, ensuring that the iPad's screen doesn't lose any of its luster or color, while ZoneFoker also claims that it's smoother than other protectors. One other nice feature is that it allows for repeat installation, meaning that if you have a bubble when first applying the protector, you can remove it and try again. Like other protectors on this list, it's also hydrophobic and oleophobic. Very recommended, and also well-reviewed online. Editors' Recommendations
