Mobile phones and tablets will come with a browser, but depending on your mobile operating system there might be alternative mobile browsers you can use on the device. There are a number of Web browsers available to choose from each with its own distinctive look and features. With the growing popularity of smartphones and mobile devices, now there are also a number of mobile web browsers (also called a microbrowser) available to download. Mobile browsers are optimized to display Web content on the smaller mobile device screens and will perform efficiently on these devices, which have far less computing power and memory capacity as a desktop or laptop computer running a standard Web browser. Mobile phones and tablets will come with a browser, but depending on your mobile operating system there might be alternative mobile browsers you can use on the device. Editor's Recommendation: Learn how web browsers work. List of 7 Mobile Web Browsers 1. BOLT Browser Developed by Bitstream Inc., BOLT is a mobile browser that works on phones of all types. BOLT is built on a WebKit based cloud-computing architecture to enable advanced PC-Style internet functionality on mobile devices. The BOLT browser supports the HTML5 web standard and comes tightly integrated with social media applications like Facebook and Twitter. Operating System (Mobile OS): Java ME (MIDP 2.0/CDLC 1.0), BlackBerry, BREW Price: Free to end-users (BOLT website download page) 2. Dolphin Browser HD An intelligent mobile Web browser from Mobotap that supports add-ons, gestures, Multi-touch Pinch Zoom, Tabbed browsing, Sidebar, Smart Address Bar and 16 languages. Other browsers from this developer include Dolphin Browser and Dolphin Browser Mini. Operating System (Mobile OS): Android 2.0.1+ Price: Free (Android Market) 3. Firefox Mobile A The Mozilla Firefox Web browser brings the best of desktop browsing to mobile with the latest security and privacy features. Firefox mobile let's you browse favorite sites with minimal typing and access your browser history, bookmarks, passwords and open tabs from any device. Other features include tabs, personas, bookmarking and location-aware browsing. 4. Maxthon Developed by Maxthon, the Maxthon Browser lets users sync bookmarks/favorites to the cloud, switch between www and WAP versions of the Web. Other key features include speed dial, tabbed browsing, RSS reader, personalization and a download manager. Maxthon also offers a browser designed specifically for 10" tablets. Operating System (Mobile OS): Android 1.6+ Price: Free (Android Market) 5. Opera Mini Web Browser A fast mobile browser that uses Opera's servers to compress webpages so they load faster on a mobile device. Features include pinch-to-zoom, smooth panning, speed dial and built-in Twitter and Facebook support. Other mobile browsers from Opera Software include the Opera Mobile Web and Verizon Opera Mini. Operating System (Mobile OS): Android 1.5+ Price: Free (Android Market) 6. Skyfire Web Browser Skyfire is a smart and social mobile browser designed for the social networking generation. Features of Skyfire include a customizable toolbar, Flash video support, Facebook QuickView, Fireplace Feed Reader, Facebook Like and easy sharing services. Operating System (Mobile OS): Android 2.0+ Price: Free (Android Market) with option to purchase Video Licensing Key. 7. UC Browser In Apr 2004, UC launched its core product UC Browser, which now runs on almost any mobile platform - Android, iOS, BlackBerry OS, Symbian, WinCE, bada, Java, MTK and BREW. Features of the UC mobile browser include advanced compression technology to reduce mobile data costs for end-users, search, multi-tabs, download manager, URL auto-completion, night mode and file manager. Operating System (Mobile OS): Android, Symbian, Java, WM(PPC/SP), BlackBerry, iPhone, generic browser version for all phones. Price: Free (UC web Download Page) Editor's Recommendation: Mobile Operating Systems (Mobile OS) Explained. This article was originally published on October 27, 2011 All platforms: Download your favorite online video clips from YouTube, 5min, Metacafe, and more than 50 other online video sharing sites with free open source application xVideoServiceThief. Enter a URL of nearly any online video and xVideoServiceThief will automatically download the video (unless you specify otherwise). Videos can be downloaded to either FLV or AVI formats. For an alpha build, xVideoServiceThief has a few bugs; not all services were tested error-free. The application does, however, accept anonymous bug reports automatically. Regardless, the interface is pretty slick, with options to pause, cancel, and to delete downloads from the queue. An indicator displays the download status and speeds of each video. xVideoServiceThief's open source approach should mean that downloading videos from your favorite sites should never be too hard to achieve. xVideoServiceThief is a free open source download for Windows, Mac, and Linux. xVideoServiceThief (via Hehe2.net) Web site KeepVid lets you download the embedded video from 40 different web sites, including all the usual suspects (Google Video, YouTube, iFilm, etc.). If you don't like previously-mentioned Firefox extension Download Embedded, or you aren't using Firefox, KeepVid offers a simple solution for downloading embedded video to your desktop with a minimum of effort. Yesterday we mentioned Google Video Downloader, a web app dedicated to extracting the URL of the... Read more KeepVid Sure, you've gone to YouTube and watched that occasional, amusing, few-minute-long video whose URL a friend emailed you. But what if you're in the mood for something longer and at a better picture quality? We took six services offering just that out for a spin: CinemaNow, Apple's iTunes Movie store, MovieFlix, Movielink, Amazon's Unbox, and Starz's Vongo. Each has a somewhat different take on what your online movie downloading experience should be. They vary in what they offer, how you should pay, and whether you subscribe to a film library, rent, or purchase the content. Though video on demand has been a glimmer in tech execs' eyes since the turn of the millennium, the enabling technologies are finally maturing, and three of the services we review just appeared in 2006—Apple's iTunes movies, Amazon's Unbox and Starz's Vongo. There are also a lot of illegal, pirated-movie download sites out there that we don't recommend and won't dignify with publishing the names or links of. Some of them are no more than web interfaces for file-sharing technologies like BitTorrent. When a site claims "all free" movies (which they make you pay a site subscription for), you can bet it's one of these. The legal movie sites we review claim to take the trip to the video store or that wait for mail from Netflix out of your home theater viewings. Is the convenience worth it? What do you gain and what do you lose when switching to internet-delivered entertainment? Continued... Opinions expressed by Entrepreneur contributors are their own. For many people, mobile devices, especially cell phones, are fast becoming the most popular route to the Internet. They want quick, easy access to information that will help them make decisions on the go - including whether or not to patronize your business. Unfortunately not every small-business website functions well on cell phones. Many fail to load quickly, prove hard to navigate and make key information difficult to find. To make your website more mobile friendly, consider these three steps, which put a priority on usefulness, speed and easy navigation. 1. Test your site on a cellular network. Turn off your cell phone's Wi-Fi connection so you're using your wireless carrier's data network. Then, launch your web browser and type in your business site's URL. Now, start counting. If it takes five seconds or less to fully load your home page, that's pretty good. If it's 10 seconds or more, there's significant room for improvement. If your site first displays a decorative splash page, video or a large image, it isn't mobile friendly. These items take extra time to load and get in the way of useful information. Also, if your home page features Flash animation, it won't display at all in many mobile browsers, and your site might appear to say nothing at all. Related: Four Low-Cost Ways to Turbo-Charge Your Website If your phone simply displays a miniature version of your complete website, that means mobile users must pinch, zoom and scroll to see what's there. That's more work, plus they're more likely to accidentally click the wrong link or button. Your business's most basic and vital information - such as address, hours and phone number - should be immediately visible when your site loads on a mobile device. To get the most comprehensive results, repeat this exercise on several types of mobile phones. Consider asking your friends to access your site on their phones while you watch. Observe but don't coach them on where to scroll or click. 2. Start with easy improvements. Depending on the results of your tests, your site may need a major overhaul or just some tweaks. If a redesign seems necessary but is more than you can manage at the moment, you can start with a quick and easy fix. If it isn't already there, put the following information at the top of your site's home page: Business name Brief description, such as "tax accountants," "auto repair" or "fine French dining" Street address Hours of operation Phone numbers for inquiries or reservations Email address Link to the mobile version of your site (I'll explain this later) This information should appear above any background or banner graphics so it loads first. After all, this is what most mobile visitors want to know. Related: Step-by-Step Through a Website Makeover There are several advantages to displaying this information as plain text rather than including it in an image. In most mobile web browsers, simply clicking a phone number starts the call. Similarly, clicking a street address launches the phone's mapping app, and clicking an email address opens the mobile email app. If you make it this easy for mobile users, they're much more likely to do business with you. 3. Build a user-friendly mobile version of your site. Creating a mobile version of your site can be fairly straightforward. If you built your site with tools that offer a mobile theme layout, then you simply need to select a theme and apply it to your site. WordPress, one of the most popular site-building tools, has many free and inexpensive mobile themes. You also can build a separate mobile site. There are many inexpensive services that nontechnical people can use, including Mofuse.com and Landr.co. Both let you create and publish a basic mobile site for less than \$10 a month. Related: Is Your Website Lost in Translation? Mobile sites have a slightly different web address than the full site. The mobile version usually starts with "m." before your regular web address, or ends with the suffix ".mobi" rather than ".com." If a mobile user types in your regular URL or follows a link to your site from a search engine, the mobile version should load automatically. But that doesn't always happen on every phone. Include at the top of your website a link to your mobile site, and vice versa, just in case. If you follow these three steps, not only will your business be more attractive and useful to mobile visitors, but you also may become more visible in mobile search results.
